About Camfil

Air filter solutions for demanding tasks

Dedicated research, innovative development and uncompromising quality control – with these objectives in mind, the Camfil Group develops and distributes pioneering product solutions for air filter systems and clean room technology.

The German subsidiary Camfil GmbH, with its headquarters in Reinfeld, was established in 1966. Since then, the Holstein-based company, with the high-revenue air filter market in Germany, has played a key role in the leading international position of the parent group: The global player, based in Stockholm in Sweden, is characterized by its own product development and manufacturing at 30 sites and a tightknit sales network across all continents. The areas of use for the various coarse dust, fine dust, particle and molecular filters plus accessories include the food and pharmaceutical industry, clinics and hospitals, airports, automotive manufacturers, museums, hotels, schools, offices and department stores.

The product range covers all filtration needs, extending from standard pocket filters for air-conditioning and ventilation technology to highly specialised particulate air filter solutions for applications that react in an extremely sensitive manner to air contamination. Our product portfolio is rounded off with activated carbon filters, which are used to eliminate gaseous substances in a wide range of applications, as well as numerous filter housing variants.
